

A Million Reasons Why Conformation Matters Study

Correlations Between
Classification Scores
and Economic Traits of
Interest

Data

Holstein Association USA official classification scores were used for linear classification data

The first classification score for a cow assigned in her first lactation was used for analyses

Official DHIA records were used for production and culling data

Only cows born after 1/1/90 were included in analyses

Only test dates after 1/1/00 were included in test day analyses

Data

Lactations starting between 1/1/00 and 8/27/21 were included in analyses

For lifetime production analyses only first 6 lactations were included

Only cows calving for first time before 1/1/16 were included in lifetime analyses

Only animals with complete 305-day lactations were included in 305-day milk analyses

All DHIA data was edited to remove biologically unlikely test day results

Data

Only 1st lactation records with age at first calving between 18 to 35 months were included

Lactation records with milking frequencies >3 were removed

After edits, 937,603 cows were available for analyses

5,496 unique herds were represented in the data set

Cows were only included in the final analysis if there were at least 5 herdmates in their herd, year, and season of calving

Analyses

Cows were categorized into quartiles for each trait with approximately the same number of cows categorized into each category

The CORR Procedure of SAS 9.4[®] was used to calculate correlations between type and production traits

The FREQ Procedure of SAS 9.4[®] was used for the percent of cows surviving to 6 years old analyses

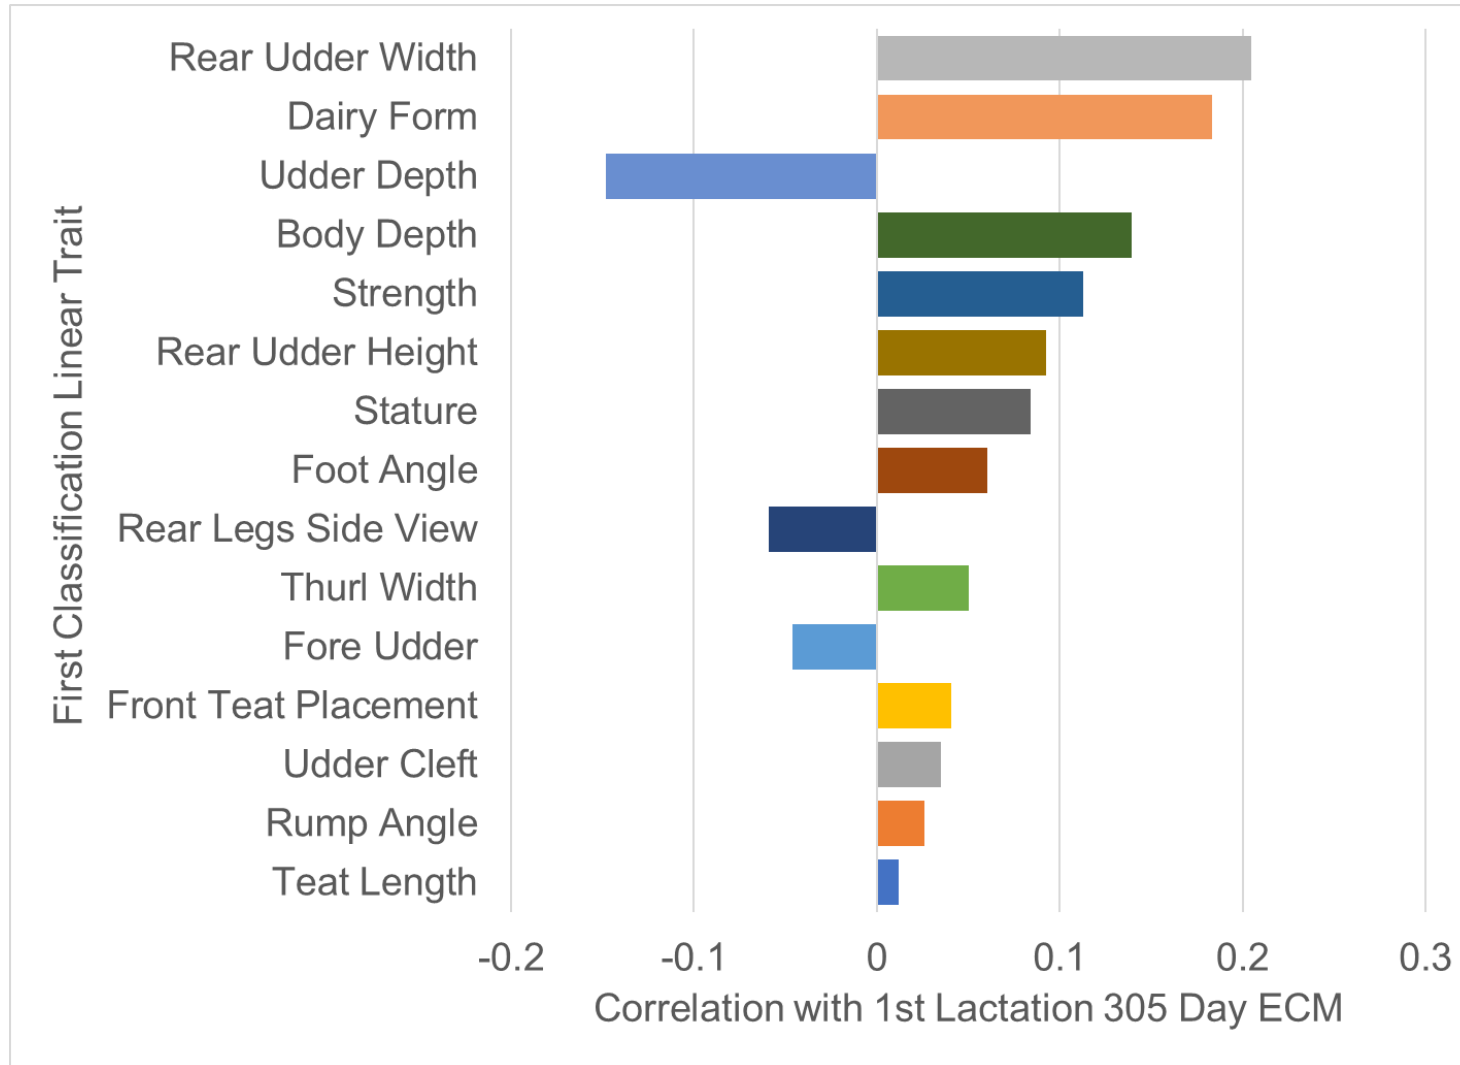

The MIXED Procedure of SAS 9.4[®] was used for modeling 1st lactation ECM, SCS, lifetime DIM, and lifetime ECM using a compound symmetry covariance structure. Subject was herd-year-season. Milking frequency was a covariate in the 1st lactation ECM model

LSMeans are presented with statistical significance presented at $p < 0.05$
